

## ATTENTION:

You are installing a SOLID twin-disc clutch system, on a transmission that originally came with a DUAL-MASS flywheel that was originally designed to reduce chatter within the clutch system. When replacing the original equipment with a SOLID-DISC Racing clutch, you WILL experience clutch chatter and louder than average clutch noise. THIS IS NORMAL!

If you are a shop installing this system for a customer, you need to edify the customer as to what they are going to experience before they pick the vehicle up.

With all racing clutches, this clutch has a lower than normal moment of inertia, as such it requires a different driving style that takes time to get used to. If you have any questions don't hesitate to call/text : 803-792-7189

Sincerely, Collins Performance Technologies
